**Subject:** example bulletin

In combination with the 110 foot in-field wind-directional spray drift buffer, a 57 foot omnidirectional infield buffer is required to protect federally listed threatened and endangered species. Non-sensitive areas defined below may be included as part of the buffer.

Non-sensitive areas – (must be consistent across all three labels)

- The following areas may be included in the buffer distance calculation when directly adjacent to the treated field edges:
  - Roads, paved or gravel surfaces, mowed and/or managed areas adjacent to field such as rights of way.
  - Planted agricultural fields containing: corn, dicamba tolerant cotton, dicamba tolerant soybean, sorghum, proso millet, small grains and sugarcane. If the applicator intends to include such crops as dicamba tolerant cotton and/or dicamba tolerant soybeans in the buffer distance calculation, the applicator must confirm the crops are in fact dicamba tolerant.
  - Agricultural fields that have been prepared for planting
